May 19, 2015

## ContactShield

**New innovative technology**

### ***ContactShield offers new security and data protection technology for iPhone Address Book.***

**Protects, encrypts and prevents security breach of your iOS address book Contacts**

WinSoft Inc. is proud to present a new innovative technology which defends the iOS user's address book from applications that copy that information to their servers and from attempts to hack into it, even on a cloud server.

With a single tap, users can encrypt their contacts and select which specific fields to protect (e.g., phone numbers, addresses, e-mails, notes). After verifying the user's password/fingerprint, standard address book operations-such as making phone calls and sending SMS messages-become available on ContactShield, even if the address book data is encrypted. Synchronization with the user's cloud encrypts the data on the cloud server. Now the user's cloud and iOS data will both be protected.

"Finally I can use applications such as WhatsApp, Waze, and LinkedIn, knowing that they can access my iOS contacts but cannot use the data that I choose to encrypt," says the CEO of WinSoft. "My default address book is ContactShield with Touch ID, in which the data is protected but not encrypted."

Because ContactShield makes the data available for use in a non-encrypted format, access to ContactShield itself is protected by a Touch ID or password. Even if the user's address book (mobile device or cloud server) is compromised, the user is safe. The data that the user selected to encrypt is secured with an AES 256-bit encryption algorithm.

ContactShield is available in the iOS App Store for free until May 30. Encrypted backup of the address book is under development.
